Mobile Application

User Acceptance Testing (UAT) Report

Prepared By: Akaash Sashiraj

Test Date: May 13, 2026
Platform: iOS Mobile App
Test Type: User Acceptance Testing (UAT)
Document Version: 1.0

Executive Summary

This document presents the findings from the User Acceptance Testing (UAT) session conducted on the ShiftSmart mobile application on May 13, 2026. The testing covered all major features of the application including onboarding, job management, shift tracking, clock in/out, chat, notifications, and emergency features.

A total of 30 issues were identified during the UAT session, comprising critical bugs, standard bugs, UX improvement suggestions, and missing features. All features not listed in this report were found to be working as expected.

Total Issues	Critical Bugs	Bugs	UX / Missing
30	6	12	12

Issue Summary Table

ID	Screen / Feature	Issue Type	Priority	Status
TC-01	Navigation Bar	UX Improvement	Medium	Open
TC-02	Registration Form – TFN Field	Bug	High	Open
TC-03	Next of Kin Form	UX Improvement	Low	Open
TC-04	Required Documents	Bug	High	Open
TC-05	Required Documents – Deletion	Critical Bug	Critical	Open
TC-06	Home – Scheduled Jobs	UX Improvement	Medium	Open
TC-07	Job Detail – Location	Bug	High	Open
TC-08	Job Detail – Available Shifts	Bug	High	Open
TC-09	Job Detail – Confirm Button	Bug	Medium	Open
TC-10	Job Detail – Media Button	UX Improvement	Medium	Open
TC-11	Job Detail – Estimated Time	Bug	Medium	Open
TC-12	Chat – Find Employee	Critical Bug	Critical	Open
TC-13	Leave – Restriction Not Enforced	Bug	High	Open
TC-14	Notifications – Billing Alerts	Bug	High	Open
TC-15	Home – Contradictory Banner	Bug	Medium	Open
TC-16	Sidebar – Active State	UX Improvement	Low	Open
TC-17	Settings – Profile Picture Edit	UX Improvement	Low	Open
TC-18	Emergency SOS – Contacts Error	Critical Bug	Critical	Open
TC-19	My Documents – Dummy Data	Critical Bug	Critical	Open
TC-20	Shift Swap – Admin Portal	Missing Feature	High	Open
TC-21	Home – Duplicate Empty Message	Bug	Low	Open
TC-22	Geofence – Status Mismatch	Critical Bug	Critical	Open
TC-23	Clock In/Out – Time Mismatch	Critical Bug	Critical	Open
TC-24	Break Time – Not Syncing	Bug	High	Open
TC-25	Active Break Dialog – OK Button	UX Improvement	Medium	Open
TC-26	Early Departure Dialog – Cancel	UX Improvement	Medium	Open
TC-27	Completed Shift – Blank View	Missing Feature	High	Open
TC-28	Home – Shift Status After Complete	Bug	Medium	Open
TC-29	Home Search – Non-functional	Bug	Medium	Open
TC-30	Leave History – Employee Name	UX Improvement	Low	Open

Detailed Test Findings

TC-01 | Navigation Bar – Missing Tab Labels

UX

Screen: Chats Screen / Bottom Navigation Bar

Description: The bottom navigation bar icons have no text labels, making it unclear to first-time users what each tab represents. The App Store navigation bar (shown as reference) clearly labels each tab: Today, Games, Apps, Arcade.

Suggestion:

- Add text labels below each navigation icon (Home, Jobs, Chat, Schedule)
- Reference: App Store bottom nav is a good example of clear labeled navigation

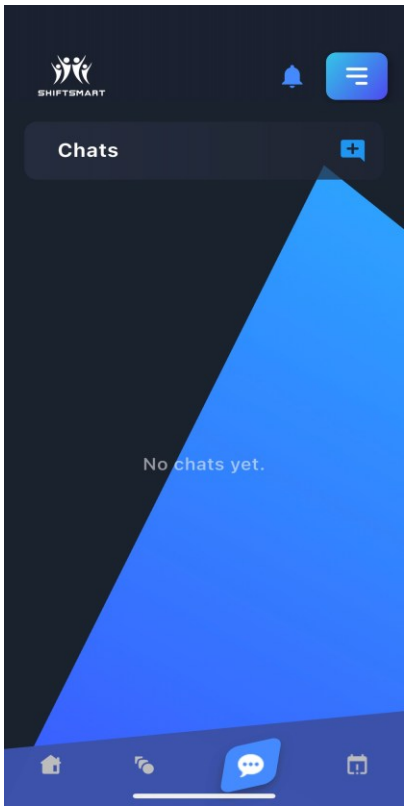

Figure 1a: ShiftSmart nav bar (no labels)

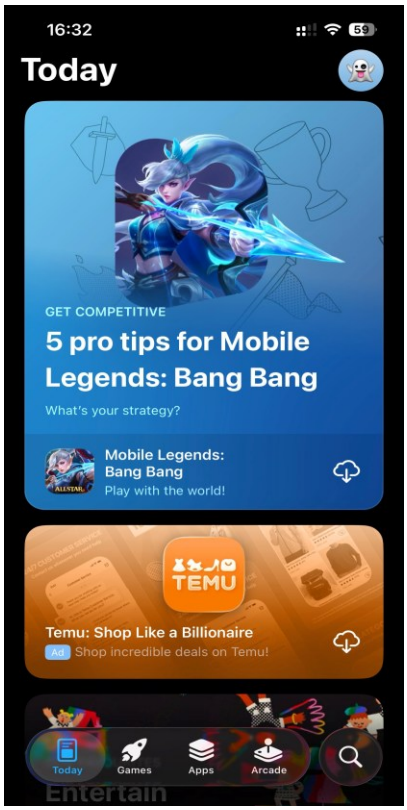

Figure 1b: App Store reference (labeled tabs)

TC-02 | Registration Form – TFN Field Hidden by Keyboard

BUG

Screen: Registration Form – Address & Employment Details

Description: When the user taps on the TFN (Tax File Number) field to type, the iOS keyboard appears but the TFN input field is hidden behind the keyboard. The form does not scroll up to keep the active field visible above the keyboard.

Expected Behavior:

- The form should automatically scroll so the active input field is always visible above the keyboard
- This is standard iOS behavior using KeyboardAvoidingView or ScrollView adjustments

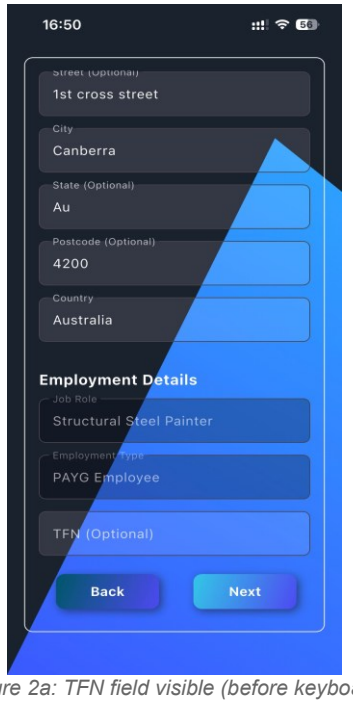

Figure 2a: TFN field visible (before keyboard)

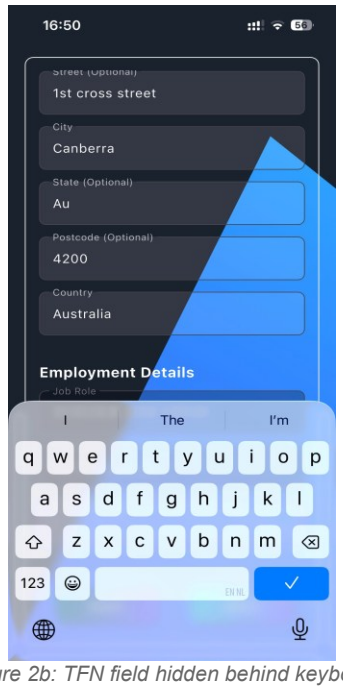

Figure 2b: TFN field hidden behind keyboard

TC-03 | Next of Kin – 'Add NoK' Button Should Update After First Entry

UX

Screen: Next of Kin Form

Description: After successfully adding a Next of Kin entry (visible as the 'marry ×' tag), the 'Add NoK' button label remains unchanged. The user has no visual feedback that they can add additional entries.

Suggestion:

- After the first NoK is added, change button label to '+ Add Another' or '+ Add Another Next of Kin'
- This clearly communicates to the user that multiple entries are supported

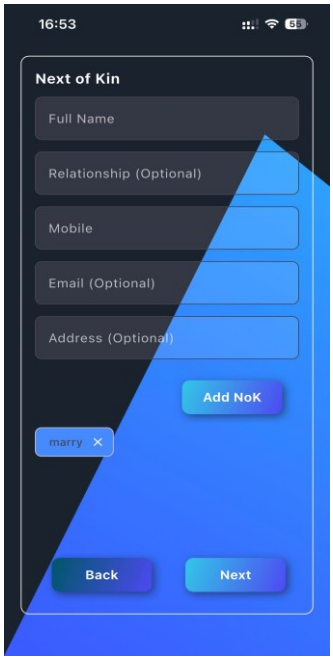

Figure 3: Next of Kin – 'Add NoK' button unchanged after adding entry

TC-04 & TC-05 | Required Documents – Delete Button & Submission Error

CRITICAL BUG

Screen: Required Documents – National Police Check

Description: The Required Documents screen shows a delete (trash) icon next to the uploaded National Police Check document. When the document is accidentally deleted and the user clicks Submit, a '500 Internal Server Error' is returned. Two separate issues were identified:

- **TC-04 (UX):** Remove the delete button for required/mandatory documents to prevent accidental deletion. Delete should only be available for optional documents.
- **TC-05 (Critical Bug):** Submitting without a required document returns a raw '500 Status Code' error. The app should validate that all required documents are present before allowing submission, and return a user-friendly error message.

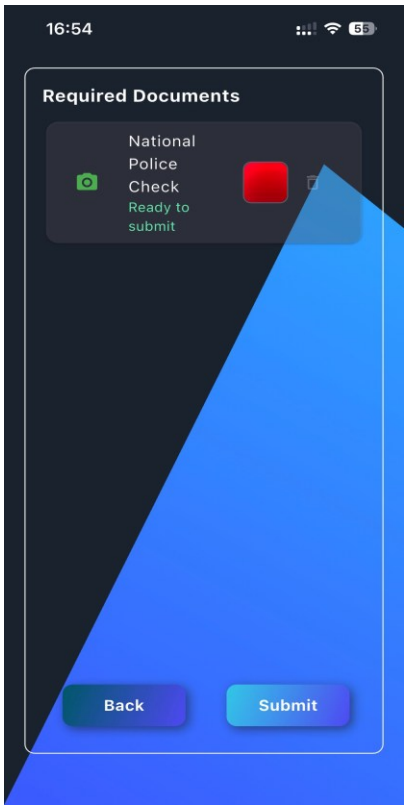

Figure 4a: Delete button visible on required document

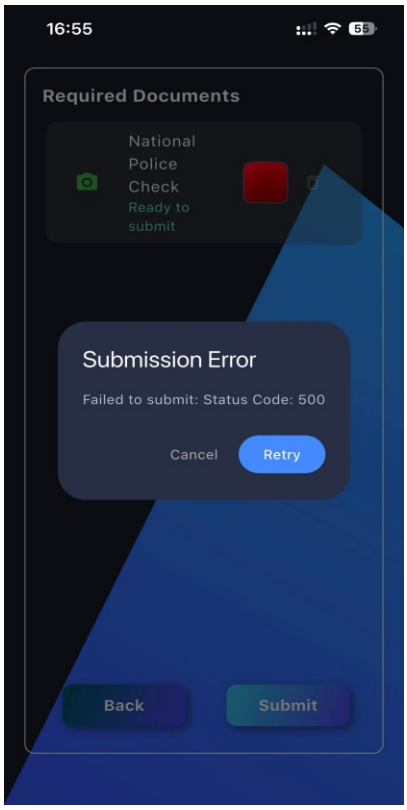

Figure 4b: 500 error on submission after deletion

TC-06 | Home – Redundant Two-Step Job Card UI

UX

Screen: Home – Today's Scheduled Jobs

Description: Tapping the first job card ('Steel Arch Repainting') expands to show a second card below it with the specific shift details. This two-step approach feels redundant and confusing — the user cannot understand why there are two separate cards for the same job.

Suggestion:

- Combine both into a single expandable card showing shift details inline
- Or navigate directly to the shift detail on tap — avoid showing a second card below

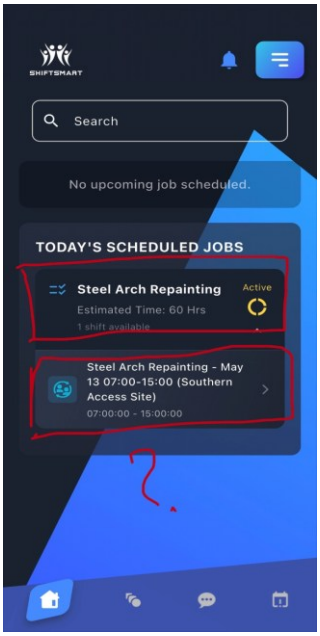

Figure 6: Two-card redundancy for the same job on Home screen

TC-07 | Job Detail – Location Shows 'Unknown Location'

BUG

Screen: Job Detail – Steel Arch Repainting

Description: The Location field on the Job Detail screen displays 'Unknown Location' even though the shift card on the previous screen clearly shows 'Southern Access Site' as the location. The location data exists in the system but is not being correctly mapped to the Job Detail view.

Expected Behavior:

- Fix the location data binding so the correct site name (e.g., 'Southern Access Site') is displayed in the Location field

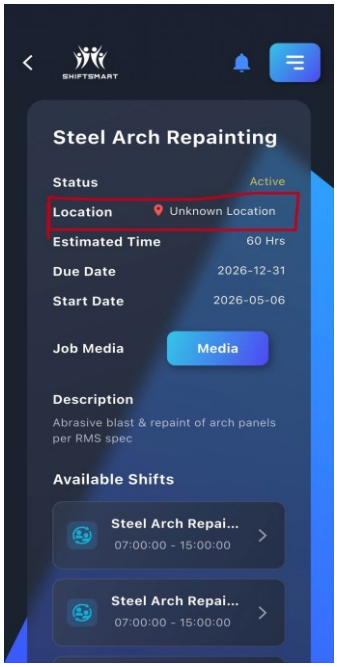

Figure 7: Job Detail showing 'Unknown Location'

TC-08 | Job Detail – Ended Shifts Showing as Available

BUG

Screen: Job Detail – Available Shifts

Description: The 'Available Shifts' section is displaying shifts that have already ended (all showing 07:00:00 – 15:00:00 for today's date). These past/expired shifts should not be listed as available for booking.

Expected Behavior:

- Only show upcoming/future shifts under 'Available Shifts'
- Move completed shifts to a 'Past Shifts' or 'Completed Shifts' section, or hide them entirely

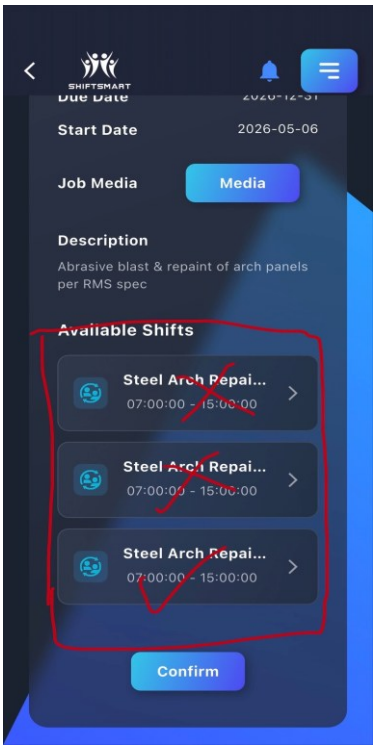

Figure 8: Already-ended shifts appearing as available (marked with red X)

TC-09 | Job Confirmation – Button Allows Repeated Confirmations

BUG

Screen: Job Detail – Confirm Job Assignment

Description: After successfully confirming a job assignment (success popup shown), the 'Confirm' button remains active and unchanged. The user can tap it again and receive the same success message repeatedly, indicating there is no state management after confirmation.

Expected Behavior:

- After confirmation, disable or hide the Confirm button
- Display a permanent status badge such as '✓ Acknowledged' or 'Already Confirmed'

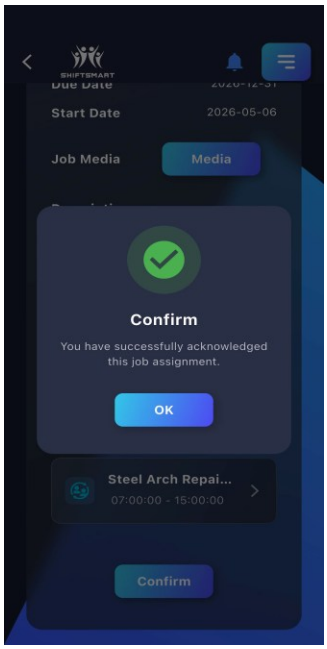

Figure 9a: Success popup after confirmation

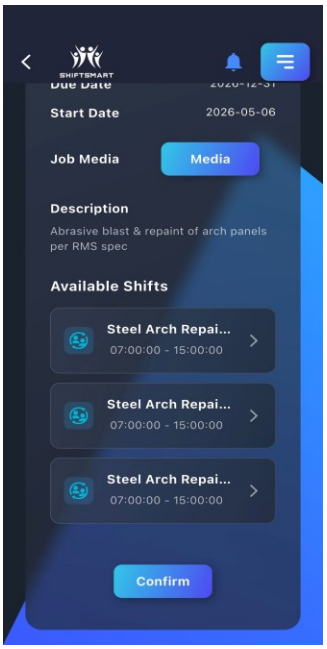

Figure 9b: Confirm button still active – allows re-confirmation

TC-10 | Job Detail – 'Media' Button is Poor UX for Job Media

UX

Screen: Job Detail – Job Media Section

Description: The Job Media section displays a plain 'Media' button with no visual indication of what media is attached. This provides no useful information to the user and is visually inconsistent with good media display patterns.

Suggestion:

- Replace the button with thumbnail image previews (2–3 small tiles) that open full-screen on tap
- Or show a media count indicator such as '📷 3 Photos' with a preview strip
- A plain button gives no visual hint about the content attached

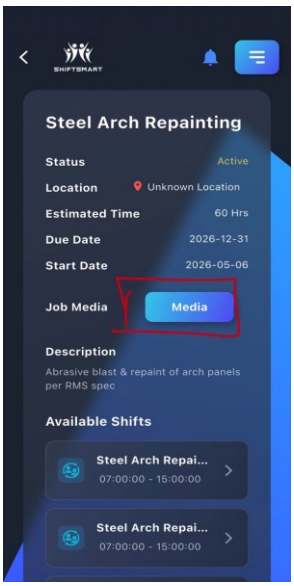

Figure 10: Plain 'Media' button – should be replaced with image thumbnails

TC-11 | Job Detail – Incorrect Estimated Time Displayed

BUG

Screen: Job Detail – Steel Arch Repainting

Description: The Job Detail screen shows 'Estimated Time: 60 Hrs' which is the total project/job estimated time. However, on the shift detail level, the actual shift duration is 07:00–15:00 (8 hours). The app is displaying the project-level estimate where the shift-level duration should be shown.

Expected Behavior:

- Clearly separate job-level estimated time (60 Hrs total) from shift-level duration (8 Hrs per shift)
- The shift card should display the correct shift duration, not the total project hours

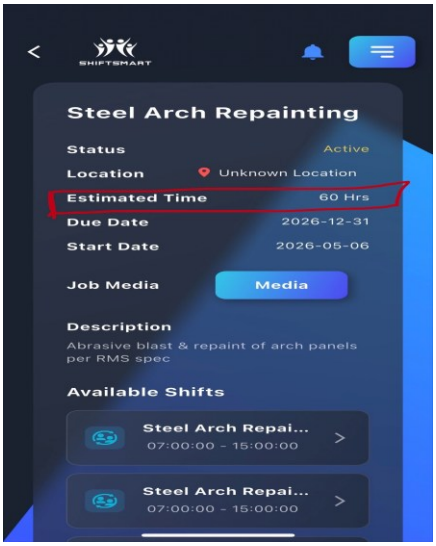

Figure 11a: Mobile showing 60 Hrs (project total)

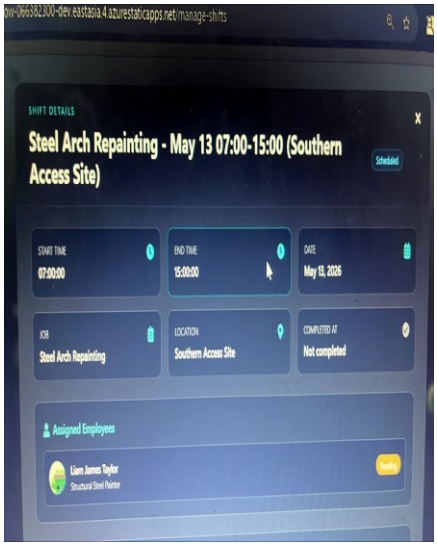

Figure 11b: Admin portal confirms shift is 07:00–15:00 (8 Hrs)

TC-12 | Chat – Find Employee Search Shows No Results

CRITICAL BUG

Screen: Chats – Find Employee Dialog

Description: The 'Find Employee' dialog in the Chats tab shows 'No users found' both when opened (no default list) and when searching for a specific name (e.g., 'Liam'). Active employees clearly exist in the admin portal, meaning the search API is not functioning. This makes the in-app chat feature completely unusable.

Expected Behavior:

- Show all available/active employees by default when the dialog opens
- Return correct filtered results when a name is typed
- Fix the user search API endpoint used in the Chat section

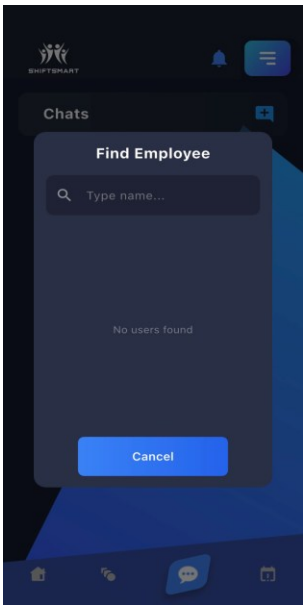

Figure 12a: Empty list on open

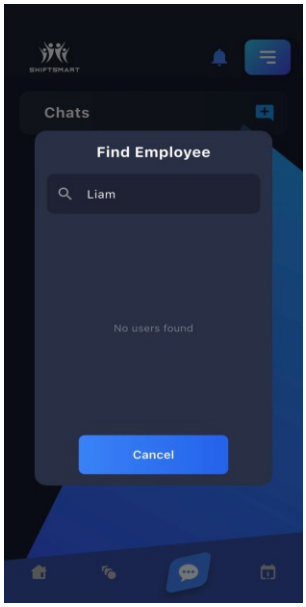

Figure 12b: 'Liam' search also returns no users

TC-13 | Leave Request – Restriction Not Enforced on Mobile

BUG

Screen: Apply for Leave (Calendar Tab)

Description: The admin portal has leave restrictions enabled for this user, but the mobile app does not respect or communicate this restriction. The user can access the Apply for Leave form fully, fill it out, and attempt submission — which then fails with 'Failed to submit leave request'.

Expected Behavior:

- The mobile app should check leave permissions on page load and enforce restrictions from the admin portal
- If restricted, hide the Apply section or show a message: 'Leave requests are currently restricted. Contact your administrator.'
- Never allow a user to fill and submit a form that will always fail on the backend

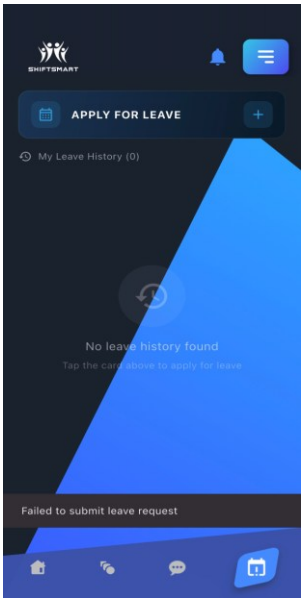

Figure 13: Leave submission fails — restriction not communicated to user

TC-14 | Notifications – Billing Alerts Visible to Employees

BUG

Screen: Notifications – Announcements Tab

Description: Tenant-level billing and subscription alerts (e.g., 'Your subscription has ended. You are now in a Grace Period.') are visible to regular employee accounts. These are internal billing messages that should only be visible to Admin/Manager roles.

Expected Behavior:

- Apply role-based visibility: Billing/subscription alerts → Admin/Manager only
- General job/shift announcements → visible to all employees
- Employees should never see internal tenant billing messages

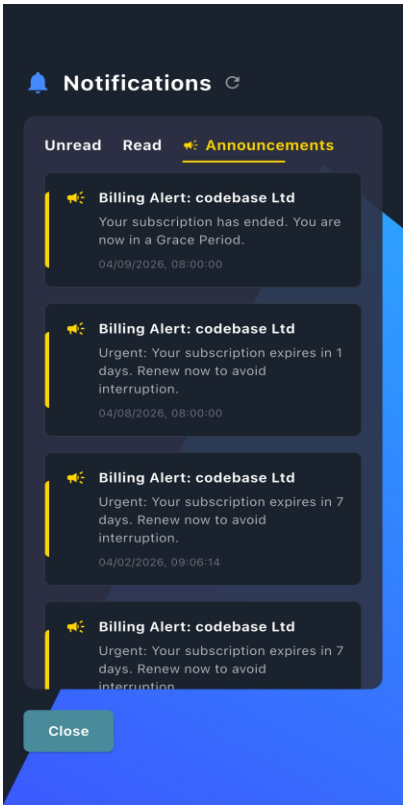

Figure 14: Billing alerts visible to employee account

TC-15 | Home – 'No Upcoming Job' Banner Contradicts Visible Jobs

BUG

Screen: Home Screen

Description: The 'No upcoming job scheduled.' banner appears at the top of the home screen at the same time as 'TODAY'S SCHEDULED JOBS' section shows an active job ('Steel Arch Repainting'). Both messages are displayed simultaneously, which is contradictory and confusing.

Expected Behavior:

- If scheduled jobs exist → hide the 'No upcoming job scheduled' banner completely
- Only show the empty state banner when there are truly no jobs at all
- These two states should be mutually exclusive

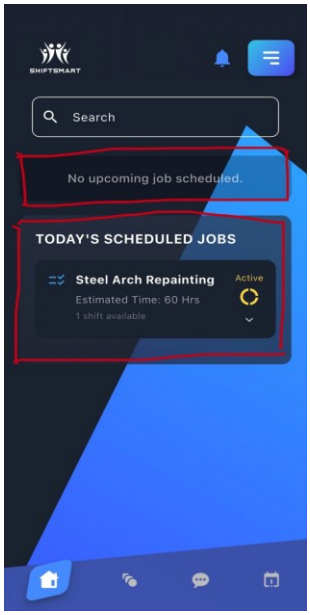

Figure 15: 'No upcoming job' banner shown alongside active scheduled jobs

TC-16 | Sidebar Navigation – No Active State Indicator

UX

Screen: Side Navigation Drawer

Description: When the sidebar is open from the Home screen, the 'Home' menu item does not have a clear active/highlighted visual state. A very faint underline is barely noticeable and fails to communicate which section the user is currently viewing.

Suggestion:

- Highlight the active item with a solid background color (e.g., blue/teal fill)
- Use bold text and a bright icon color for the active menu item
- This is a standard navigation pattern across mobile apps

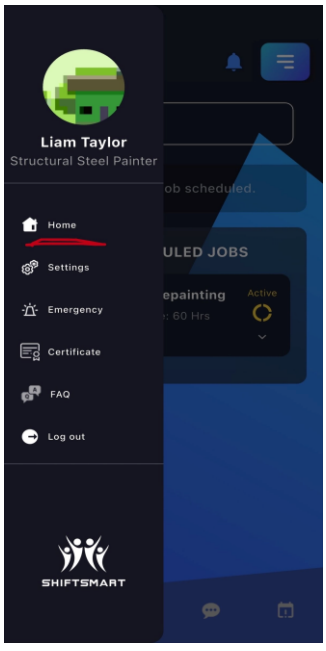

Figure 16: Sidebar with barely visible active state on 'Home'

TC-17 | Settings – No Option to Edit Profile Picture

UX

Screen: Settings Screen

Description: The Settings screen displays the user's profile picture but provides no option to change or update it. There is no edit button, camera icon, or tap interaction on the profile photo.

Suggestion:

- Add a small camera/pencil icon overlaid on the bottom corner of the profile picture
- Tapping it should present options: 'Take Photo' or 'Choose from Gallery'
- This is a standard and expected feature in mobile apps with user profiles

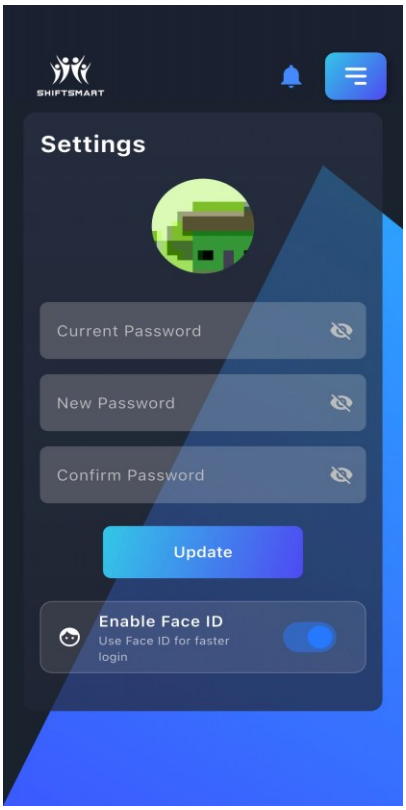

Figure 17: Settings screen – no profile picture edit option

TC-18 | Emergency SOS – Contacts Not Loading (Critical)

CRITICAL BUG

Screen: Emergency SOS Screen

Description: The Emergency SOS screen fails to load emergency contacts despite the user having an approved Next of Kin (Sarah Jane Taylor, Spouse) in the admin portal. Two error states were observed: (1) A raw technical exception message, and (2) 'No emergency contacts available'.

- **Critical Bug:** Type mismatch error: 'Exception: Error getting contacts: type Null is not a subtype of type int' — a null value is not handled properly in the code
- **Data Mapping Bug:** Approved Next of Kin data from the portal is not being fetched/mapped to the SOS screen's emergency contacts
- **UX Bug:** Raw technical exception shown directly to user — should show a friendly error message

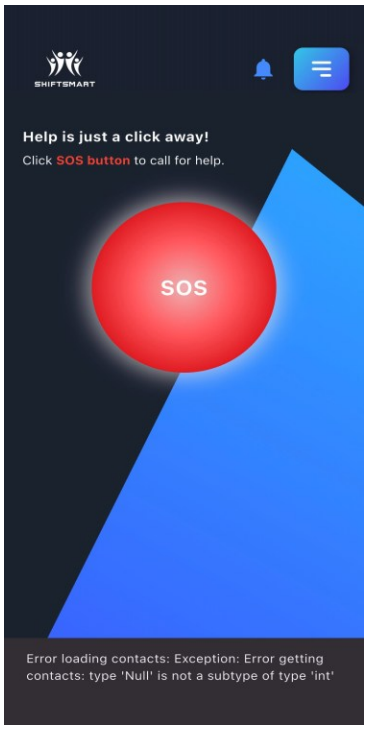

Figure 18a: Raw exception shown to user

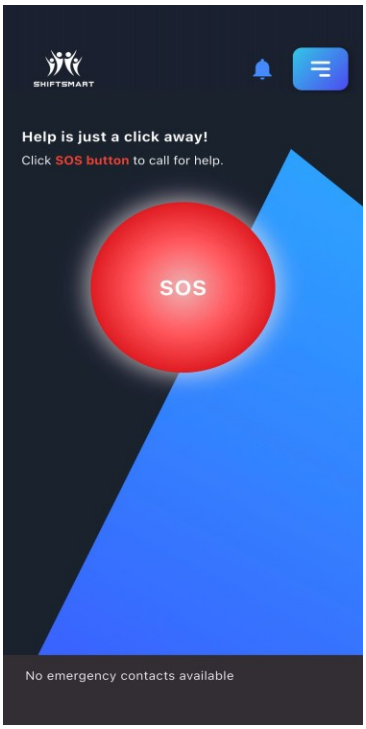

Figure 18b: 'No emergency contacts' despite NoK existing in portal

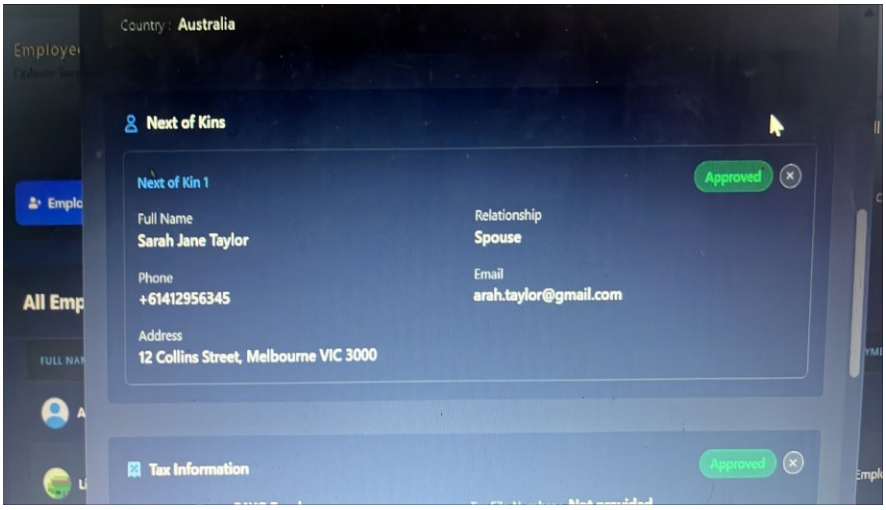

Figure 18c: Admin portal confirms Next of Kin (Sarah Jane Taylor) is approved

TC-19 | My Documents – Showing Hardcoded Placeholder Data

CRITICAL BUG

Screen: My Documents

Description: The My Documents screen shows 3 cards all displaying the same placeholder text 'DOCUMENT' and 'Verified Document'. No actual document names, file types, or real data are displayed. The cards appear to be hardcoded/dummy UI left in a development state. Tapping the cards produces no action.

Expected Behavior:

- Fetch and display actual document names from the backend (e.g., 'National Police Check')
- Show document type, upload date, and dynamic status (Verified, Pending, Rejected)
- Make each card tappable to open/preview the document (PDF viewer or image viewer)

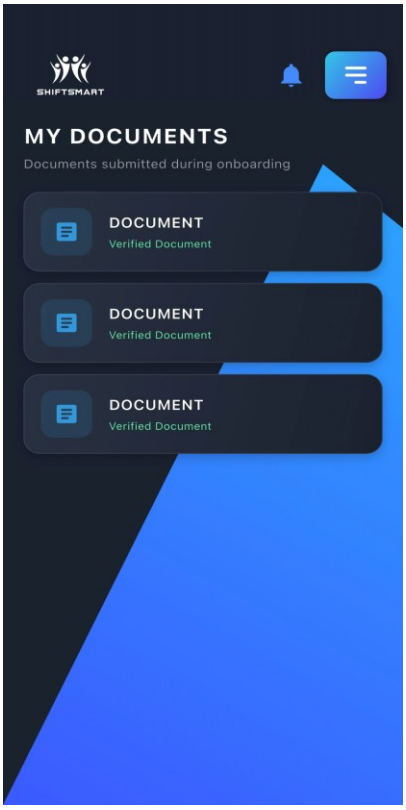

Figure 19: My Documents showing hardcoded 'DOCUMENT' placeholder for all entries

TC-20 | Shift Swap – No Approve/Reject Option in Admin Portal

⚠ **MISSING FEATURE**

Screen: Shift Detail – Swap Request (Mobile + Admin Portal)

Description: An employee can submit a swap request from the mobile app which shows 'Swap Requested. Waiting for approval.' status. The admin portal shows the 'Swap Requested' badge next to the employee's name, but there are no Approve or Reject buttons — only Delete and Edit the whole shift are available. The swap workflow is broken end-to-end.

Expected Behavior:

- Add a Swap Requests management section in the admin portal
- The 'Swap Requested' badge should be clickable and open an approval dialog
- Approval dialog should have: swap details, Approve and Reject buttons with optional reason
- Send a notification back to the employee once the admin acts on the request

Figure 20a: Mobile shows swap pending

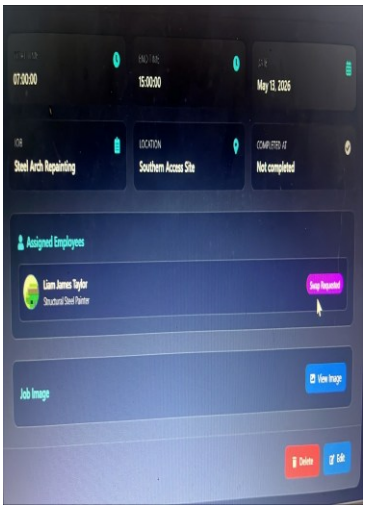

Figure 20b: Admin portal shows badge but no approve/reject action

TC-21 | Home – 'No Upcoming Job' Message Appears Twice

BUG

Screen: Home Screen (Empty State)

Description: When there are no jobs, the message 'No upcoming job scheduled.' appears twice on the same screen — once in the top banner area and again inside the 'TODAY'S SCHEDULED JOBS' section. This appears to be two separate UI components independently rendering the same empty state.

Expected Behavior:

- Show the empty state message only once
- When no jobs exist, hide the 'TODAY'S SCHEDULED JOBS' section header entirely or merge both into a single clean empty state

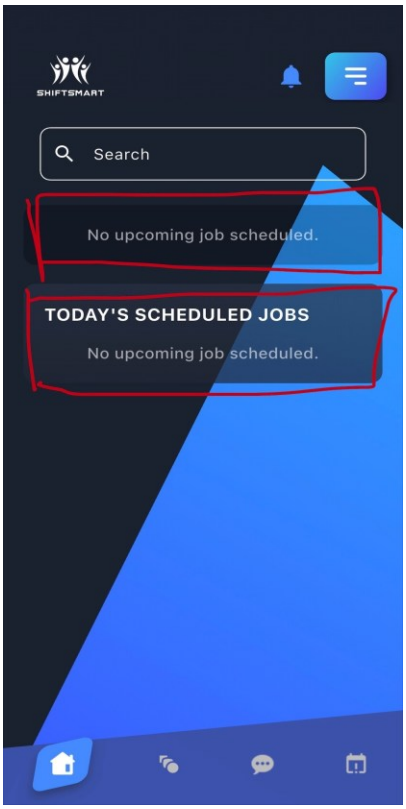

Figure 21: Same empty state message appearing twice on Home screen

TC-22 | Geofence – Status Mismatch Between Mobile and Admin Portal

CRITICAL BUG

Screen: Live Location / Geofence Tracking

Description: The mobile app and admin portal are showing completely opposite geofence statuses for the same employee at the same time. Mobile app shows 'You are On Site – Ready to clock in/out' (green), while the admin portal shows 'Outside Fence'. This is a high priority issue as it directly affects clock in/out accuracy and payroll integrity.

Possible Root Causes:

- Different GPS coordinate sources between mobile and admin portal
- Sync delay — admin portal showing cached/old location
- Geofence radius inconsistency between mobile calculation and portal
- GPS coordinate precision differences pushing result across the boundary

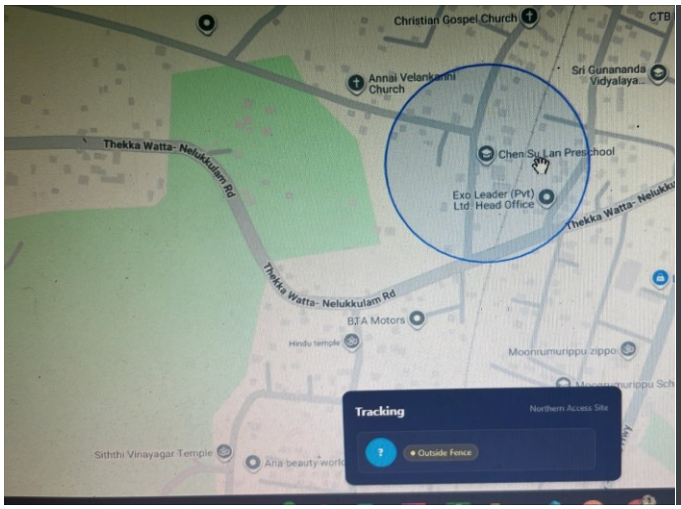

Figure 22a: Admin portal shows 'Outside Fence'

Figure 22b: Mobile shows 'You are On Site'

TC-23 | Clock In/Out – Incorrect Timestamp & Total Time Calculation

CRITICAL BUG

Screen: Shift Detail – Clock In/Out & Shift Summary

Description: The Clock Out section on mobile incorrectly displays '06:38:15 AM' which is actually the Clock In time, not the Clock Out time. Additionally, the Shift Summary shows 'Total Time: 0h 12m' for a shift from 06:38 AM to 12:20 PM — which should be approximately 5 hours 42 minutes. This was previously fixed but appears to have regressed.

- **Bug 1:** Clock Out timestamp field incorrectly displays the Clock In time (06:38 AM)
- **Bug 2:** Total Time calculation is completely wrong (shows 0h 12m instead of ~5h 42m)
- **Bug 3:** Time format inconsistency — admin portal uses 24-hour format, mobile uses 12-hour AM/PM
- **Regression:** This issue was previously fixed by Malindu but has reappeared — needs regression testing

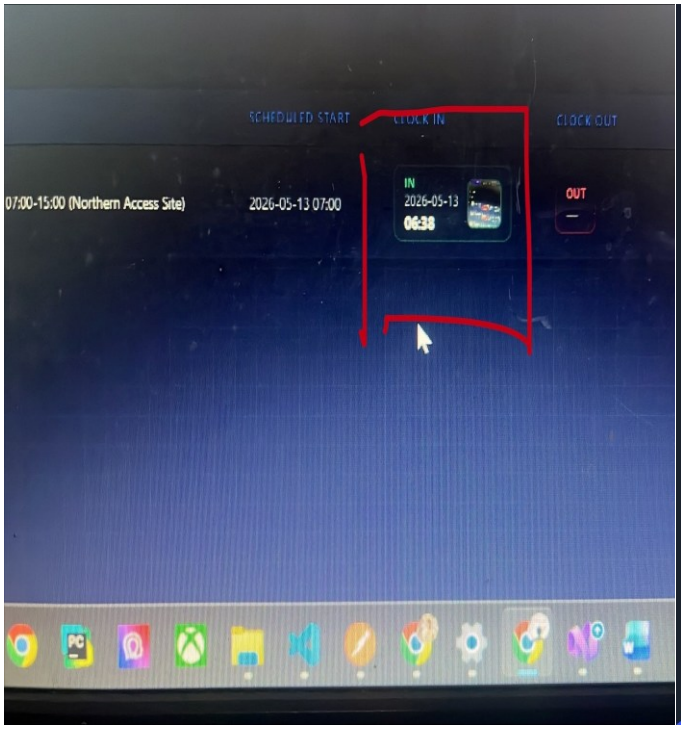

Figure 23a: Admin portal showing Clock In: 06:38

Figure 23b: Mobile incorrectly showing 06:38 as Clock Out time

TC-24 | Break Time – Not Syncing to Admin Portal

BUG

Screen: Shift Detail – Break Tracking

Description: The employee took 3 breaks totaling approximately 7 minutes (12:10–12:13, 12:13–12:16, 12:16–12:17), all correctly recorded in the mobile app's Break History. However, the admin portal shows 'Break Time: 0m' — the break data is not syncing to the backend.

Impact:

- Payroll calculations based on break time will be incorrect
- Attendance records in the admin portal are unreliable

Expected Behavior:

- Fix the break clock-in/out API to ensure break start and end times are saved to the backend in real-time

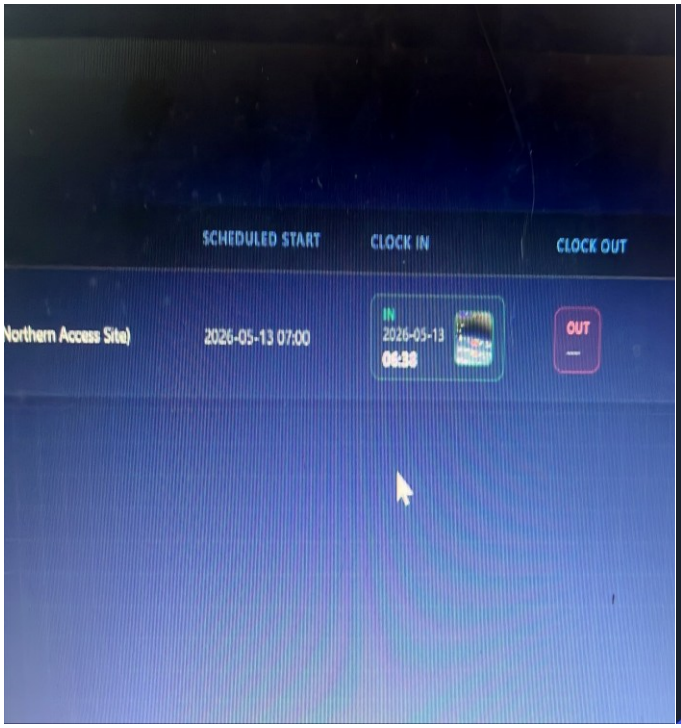

Figure 24a: Admin portal shows Break Time: 0m

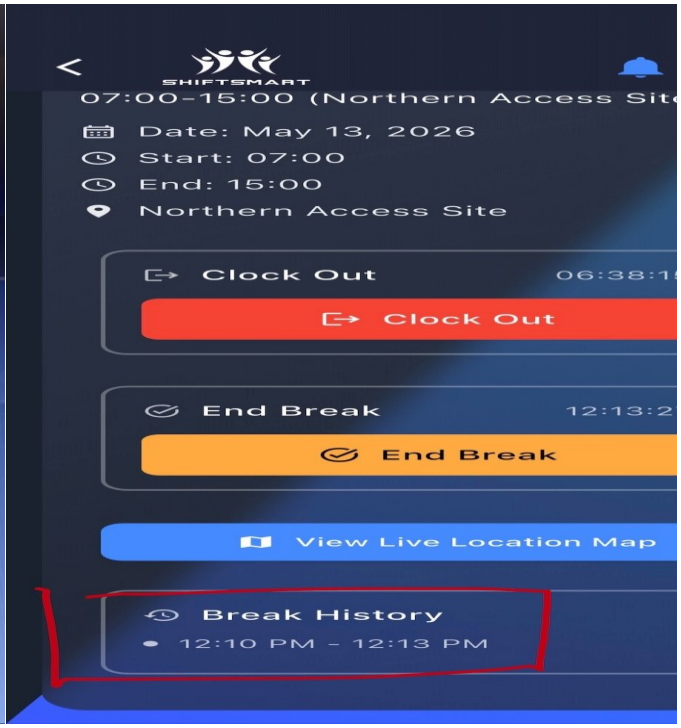

Figure 24b: Mobile correctly shows 3 breaks in Break History

TC-25 | Active Break Dialog – 'OK' Button Invisible

UX

Screen: Shift Detail – Active Break Warning Dialog

Description: The 'Active Break' warning dialog ('You cannot clock out while on a break. Please end your break first.') has an 'OK' button that appears as plain unstyled text with no background, border, or visual affordance. It is very easy to miss.

Suggestion:

- Style the OK button consistently with other app buttons — add background color, padding, and rounded corners
- Increase the dialog message font size for better readability
- Apply consistent dialog button styling across all dialogs in the app

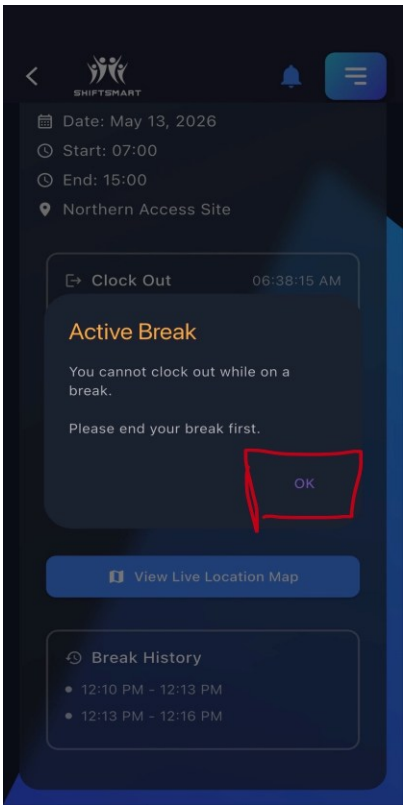

Figure 25: Active Break dialog – 'OK' button barely visible (circled in red)

TC-26 | Early Departure Dialog – 'Cancel' Button Not Styled

UX

Screen: Shift Detail – Early Departure Warning Dialog

Description: The 'Early Departure Warning' dialog has the same issue as TC-25 — the 'Cancel' button is displayed as plain unstyled text with no visual button styling, while 'Yes, Clock Out Early' has proper orange button styling. This creates an inconsistent and potentially dangerous pattern where users may not see the cancel option.

Suggestion:

- Style 'Cancel' as a secondary button (outlined or grey filled) with clear padding and border
- Maintain visual hierarchy: primary action (orange filled) vs secondary action (outlined)
- Apply this consistent pattern to ALL dialogs in the app

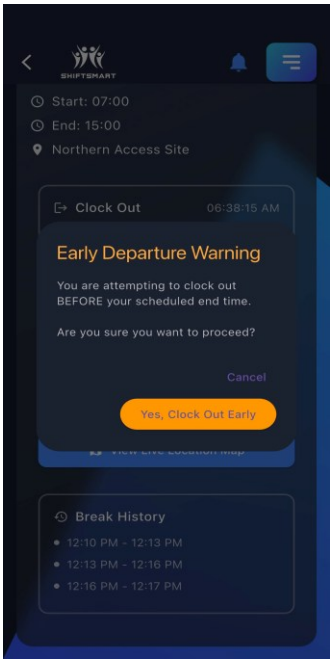

Figure 26: Early Departure dialog – 'Cancel' button has no styling

TC-27 | Completed Shift – Blank View After Shift Ends

⚠ **MISSING FEATURE**

Screen: Completed Shift Detail

Description: After a shift is completed and the user navigates back to it, the shift detail screen shows only the basic shift info card (job name, date, times, location) with a completely blank area below. All clock-in/out records, break history, and shift summary that were visible during the active shift are gone.

Expected Behavior:

- Completed shift view should permanently display a full shift report
- Include: Clock In time, Clock Out time, Total Time Worked, Break History, Total Break Duration, Early Departure notice (if applicable)
- This gives employees a permanent timesheet record they can refer back to at any time

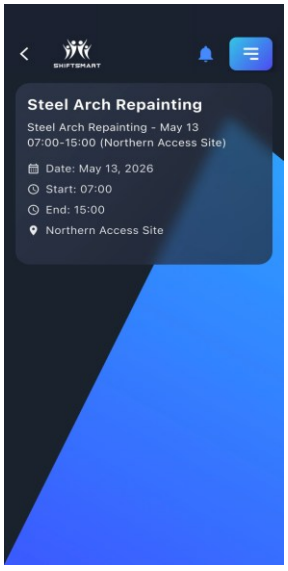

Figure 27: Completed shift view – blank area below shift info card

TC-28 | Home – Completed Shift Still Shows as 'Active'

BUG

Screen: Home – Today's Scheduled Jobs

Description: After a shift is completed and clocked out, the Home screen still shows the job card under 'TODAY'S SCHEDULED JOBS' with 'Active' status. The shift status does not update to reflect completion.

Expected Behavior:

- Change the section label or card to indicate 'COMPLETED' status after clock out
- Update the status badge from 'Active' (yellow) to 'Completed' (green ✓)
- Completed shifts should look visually distinct from active/upcoming ones

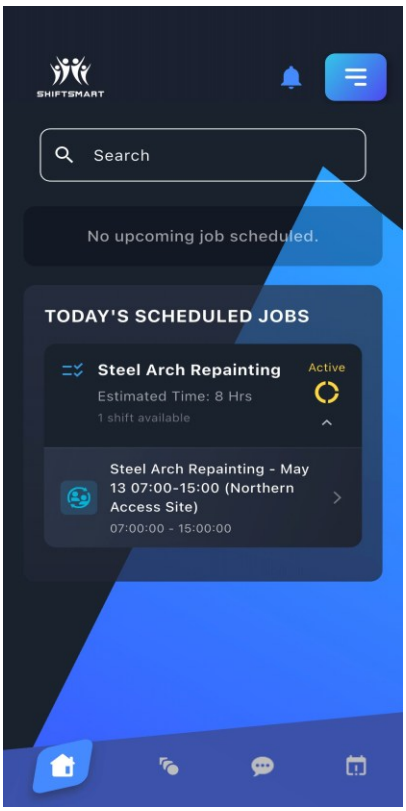

Figure 28: Completed shift still showing as 'Active' on Home screen

TC-29 | Home Search Bar – Non-functional

BUG

Screen: Home – Search Bar

Description: The search bar on the Home screen does not return any results or filter any content when typed into. Searching for 'akaash' (an admin user in the system) shows no results and the job list below remains completely unchanged.

Issues:

- Search produces no visible results or content filtering
- No 'No results found' message — screen simply stays unchanged
- Placeholder text 'Search' gives no hint of what can be searched

Expected Behavior:

- Implement search filtering for jobs/shifts by name or location
- Show a 'No results found for X' message when search returns nothing
- Update placeholder text to clarify scope: e.g., 'Search jobs, shifts…'

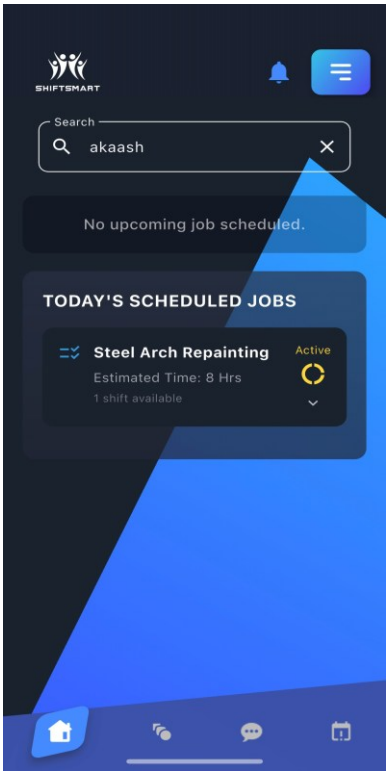

Figure 29a: Search returns nothing

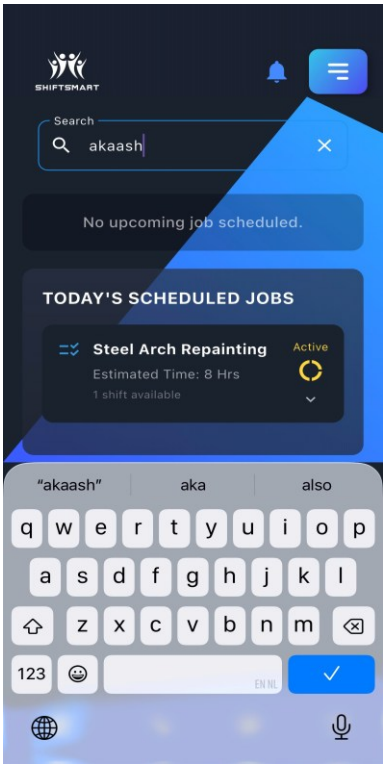

Figure 29b: Keyboard visible, still no filtering

TC-30 | Leave History – Employee Name Redundantly Displayed

UX

Screen: Apply for Leave – My Leave History

Description: Each leave request card in 'My Leave History' displays the employee's own name ('bathu Daya') at the top of every card. Since this is the employee's own leave history screen in their own account, showing their name on every card is redundant and wastes valuable card space.

Suggestion:

- Remove the employee name from leave history cards
- Use the freed space to show a leave reference ID or submitted date instead
- Keep: Status badge, Leave Type, Date range — these are all relevant and useful

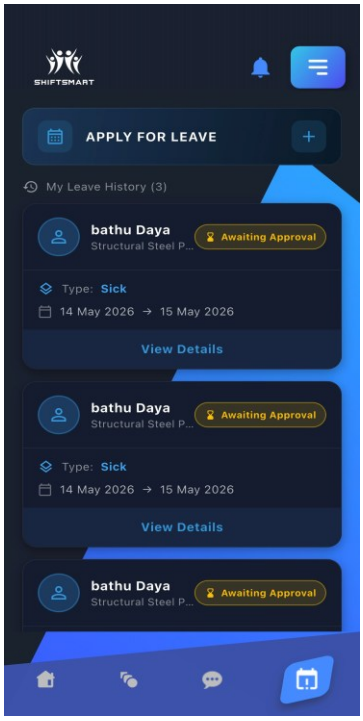

Figure 30: Leave history cards showing redundant employee name on every entry

TC-31 | Notifications – Not Receiving Push Notifications + Tab Inconsistency

BUG

Screen: Notifications Panel

Description: No notifications are being received on the mobile app at all — including critical ones like shift assignment notifications. Additionally, the Read tab shows a completely blank screen with no empty state message. The notification tab styling is also inconsistent across the three tabs (Unread, Read, Announcements).

- **Bug 1:** Push notifications not working — shift assignments and other key events produce no notifications
- **Bug 2:** Empty state missing on the Read tab — should show 'No read notifications yet'
- **UX:** Tab styling inconsistent — Unread (white, no underline), Read (yellow underline), Announcements (icon, no underline) — all three should follow the same design pattern

Figure 31: Notifications 'Read' tab – blank with no empty state message

Recommendations & Priority Actions

High Priority – Fix Before Release

- **TC-22: Geofence status mismatch between mobile and admin portal — payroll integrity at risk**
- **TC-23: Clock in/out timestamp and total time calculation errors — payroll accuracy at risk**
- **TC-18: SOS Emergency contacts not loading — safety critical feature**
- **TC-12: Chat Find Employee broken — core communication feature unusable**
- **TC-19: My Documents showing hardcoded dummy data — feature non-functional**
- **TC-05: 500 error on required document deletion — poor error handling**
- **TC-24: Break time not syncing to admin portal — payroll records inaccurate**
- **TC-31: Push notifications not being received at all**

Medium Priority – Fix in Next Sprint

- TC-02: TFN field hidden by keyboard — affects onboarding completion
- TC-07: Location showing 'Unknown Location' on job detail
- TC-08: Ended shifts appearing as available shifts
- TC-13: Leave restriction not enforced on mobile frontend
- TC-14: Billing alerts visible to employee role
- TC-15: Contradictory empty state banner alongside visible jobs
- TC-20: Shift swap has no admin approve/reject workflow
- TC-27: Completed shift detail is blank — no shift summary visible
- TC-29: Home search bar is non-functional

Low Priority – UX Improvements

- TC-01: Add text labels to bottom navigation bar tabs
- TC-03: Update 'Add NoK' to 'Add Another' after first entry
- TC-09: Disable Confirm button after first confirmation
- TC-10: Replace 'Media' button with image thumbnails
- TC-16: Add clear active state to sidebar navigation items
- TC-17: Add profile picture edit option in Settings
- TC-25 & TC-26: Style dialog buttons (OK and Cancel) consistently
- TC-28: Update Home screen to show completed shift status
- TC-30: Remove redundant employee name from leave history cards

— End of UAT Report —

ShiftSmart Mobile UAT | May 13, 2026 | Document Version 1.0
